

Mock Server Tab

The purpose of this tab is to:

1. Define API mocks for your REST APIs. This will help you in
 - a. doing parallel development between front-end and back-end.
 - b. building proof of concepts applications.
 - c. removing front-end dependency on back-end.
2. To view the logged requests coming to Mock server. This will help you in
 - a. creating API mock easily instead of creating it automatically.
 - b. validating incoming requests to vREST.

Mock Server tab provides the above two major functions:

1. [API Mocks](#)
2. [Mock Logger](#)
