

Capturing, Analyzing and Managing Requirements

Requirements can be processed in 2 different tables:

- Planned Requirements is essentially an approved set of requirements
 - Requirement Manager OR users with authority can directly create / edit requirements under "Planned Requirements" and assign values to their attributes.
 - They can also upload requirements through the CSV import function.
- Any user (if permitted by Admin) can create requirement under "Unplanned Requirements".
 - If found suitable, these can be moved to "Planned Requirements" by Requirement Manager or any other user authorized to perform this operation.
 - The user can upload requirements through the CSV import function in this table as well.

The following sub-sections explain all dimensions of collecting, analyzing and managing Requirements.

The screenshot shows the JIRA Requirements Management interface. The top navigation bar includes 'JIRA', 'Dashboards', 'RMsis', 'Projects', 'Issues', 'Boards', and 'Create'. Below this is the 'RMsis Home | RMsis Administration' section with a search bar and user information 'Optimizory | admin | Feedback'. The main content area is titled 'Planned Requirement | Unplanned Requirement' and contains a table of requirements. The table has columns for 'Id', 'Requirement Summary', 'Description', 'BL', 'Categories', 'Depends On', 'Dependents', 'Release Id', 'Priority', 'Criticality', 'Feasibility', and 'Status'. The table lists 16 requirements, with some grouped under 'Hardware Requirements' and 'Software Requirements'. The status of each requirement is shown in the 'Status' column, with 'Open' status highlighted in red.
