

Functions and User Permissions

Users can define roles and can configure the permissions as per the organizational practices.

A typical testing team comprises of team members with different roles and hence requiring access to different functions. Consequently, the system should provide an option to configure permissions for different roles. A tentative scheme is proposed below:

Function	Test Lead / Test Manager	Testing Team Member	Tester
View Test Cases	Y	Y	Y
Create Test Case	Y	Y	
Update Test Case	Y	Y	
Delete Test Case	Y	Y	
Commit Test Case	Y	Y	
Map to Requirements	Y	Y	
View Test Cycle Status	Y	Y	Y
Create Test Cycle	Y		
Update Test Cycle (Add / Update Test Cases)	Y	Y	
Update Test Cycle Status	Y	Y	Y
Delete Test Cycle	Y		
Commit and Archive Test Cycle	Y		
Log issue against a Test Case	Y	Y	Y
