

Continuous Integration

Continuous integration is a development practice where each build is verified by automated test to detect the issues early. So that the main repository remains bug free. Here, at vREST, we have developed an external module "[vrunner](#)" which you may use to integrate with any third party continuous integration tools like [Jenkins Server](#) or [TeamCity Server](#) or [Visual Studio Team Services Server](#).

If you are working on some other environment and want vREST to be integrated with your environment then please drop your query at support@vrest.io.
