

# Setup / install contacts application

## Pre-requisites:

1. NodeJS and NPM
  - v6.10.0 LTS
  - Download and Install [Node.js](#). You can also follow this wiki (<https://nodejs.org/en/download/package-manager/>).
2. MongoDB
  - v2.6.8 or greater.
  - Download and install [MongoDB](#). You can also follow this guide (<https://docs.mongodb.com/manual/installation/>).

## Setup / Installation:

Step by step guide to install Contacts Application:

1. Clone / download the github repository in the directory of your choice.
  - a. If you have installed git, then you may clone the repository with the following command:

```
$ git clone git@github.com:dheerajaggarwal/contacts.git
```

- b. OR you may download the repository from [github](#).
2. Now, install the dependencies of this sample application

```
$ npm install
```

3. Now, test application server is ready to start. Simply execute the following command to start the application server. You may change the port number with the following command.

```
$ PORT=4050 node server.js
```

That's it. You may access test application server on <http://localhost:4050/>. This is also your contactsAppBaseURL variable which will be used in vREST test cases.
